this is basically https://www.kaggle.com/bmarcos/image-recognition-gender-detection-inceptionv3 i only changed a couple things around so it would be able to run on my computer. the link has a lot more to look at to help understand the data, but i took it out to simplify what we actually need. i think it would be relatively simple to add in variables we want to test for, i just havent tried that. so far, this one is just training on the "male" variable.

i did have some trouble with the validation testing, so that still needs some work because when I ran it, the loss kept going up and im not sure why.
